'Kona Coffee Project'

***Alternatives for Processing of Kona Coffee
Technical Recommendations***

March, April 2006

Dan Kuhn
International Agro Consulting

This paper is a discussion on the parameters of constructing a Coffee Processing facility in Kona, Hawaii.

The discussion is general in nature and does not discuss all available alternatives, as it would be too lengthy in scope.

For example:

- There is no discussion on the differences between “Wet Cribas” and “Dry Cribas”.
- Disposal of fermentation water is not discussed.
- There is no discussion about the difference in dry milling with the “Combination De-stoner, Huller, Catador” and the use of a Polisher as a Huller and independent components.
- Etc.

Therefore, this paper should help to stimulate discussion in search of the best and most economical (not always compatible) solutions to quality processing.
